

Constellation Exploring during the 2015 Spring Southern Star Party

We'll start our tour in the South, with the region around the Pointers and Triangulum Australe. Then we'll turn west and catch Scorpius setting, as well as Norma, Sagittarius, Ara & Corona Australis. Moving along the Milky Way we'll find Scutum, Aquila, Sagitta, Delphinus and finally Cygnus. Now that we're in the north, we'll see Pegasus, Triangulum and Andromeda, and then move on to an adjacent group of watery constellations: Pisces, Aquarius, Capricornus, Piscis Austrinus and finally Cetus. In the east, we may spot Lepus rising, and then we'll follow the winding path of Eridanus up to Achernar. There, the southern birds will be next on our list: Phoenix, Grus, Pavo and finally Tucana with the Small Magellanic Cloud. And to top it off, the Large Magellanic Cloud.
